

Leibniz Institute for Baltic Sea Research Warnemünde

Monitoring cruise

FS „Elisabeth Mann Borgese“

Cruise- No. EMB-095

2nd – 14th February 2015

Western and Central Baltic Sea

This report is based on preliminary data

Leibniz-Institut für Ostseeforschung
an der Universität Rostock
Seestraße 15
D-18119 Rostock-Warnemünde
Germany
Phone: +49-381-5197-0
Fax: +49-381-5197-440

1. Basic information

Ship: FS Elisabeth Mann Borgese
Nationality: Germany
Operating Authority: Baltic Sea Research Institute Warnemünde (IOW)
Cruise: EMB-095
Date: 02.02.-14.02.2015
Master: Volker Ziegner
Number of crew: 11
Chief scientist: Dr. Michael Naumann
Number of research staff: 12

Geographical area in which ship has operated:

western and central Baltic Sea

Purpose of the cruise

Monitoring cruise in the framework of HELCOM programme, additional measurement programmes to follow the Major Baltic Inflow of December 2014

Research staff:

	Name	On board	Institution	Responsibility
1	Michael Naumann	02.02.-14.02.2015	IOW	CTD, VMADCP, chief scientist
2	Johann Ruickoldt	02.02.-14.02.2015	IOW	CTD, CTD-maintenance
3	Jan Donath	02.02.-14.02.2015	IOW	CTD, QM CTD-measurements
4	Birgit Sadkowiak	02.02.-14.02.2015	IOW	Nutrients, QM laboratory analysis
5	Andrea Tschakste	02.02.-14.02.2015	IOW	Organic contaminants
6	Marion Abraham	02.02.-14.02.2015	IOW	Organic contaminants
7	Susanne Schöne	02.02.-14.02.2015	IOW	Dissolved oxygen
8	Nicolas Raab	02.02.-14.02.2015	IOW	Dissolved oxygen
9	Jan Werner	02.02.-14.02.2015	IOW	Trace gas
10	Michael Pötzsch	02.02.-14.02.2015	IOW	Biological sampling, Frahmlot
11	Stephanie Mothes	02.02.-14.02.2015	University of Rostock	Microbiological sampling
12	Uwe Hehl	02.02.-14.02.2015	IOW	Mooring, Frahmlot

Scientific equipment:

CTD + Rosette water sampler, glass bowl sampling and in situ pump for sampling of organic pollutants (PAH), Phytoplankton net (Apstein), Zooplankton net (WP2), Secchi disk, nutrient analyser, oxygen analyser, Frahmlot sediment corer, Equilibrator/sensor system for CH₄, CO₂ and N₂O measurements in surface waters

2. General remarks and preliminary result:

The first monitoring cruise of the year 2015 in a series of five expeditions performed annually by the Leibniz Institute for Baltic Sea Research Warnemünde was carried out with FS “Elisabeth Mann Borgese“ between February 2nd and 14th 2015. The cruise is part of the German contribution to the HELCOM COMBINE program and contributes to IOW’s long term data series in the central Baltic Sea. The data acquired are used for regular national and international assessments of the state of the Baltic Sea, are analysed in numerous publications, and provide the scientific basis for measures to be taken for the protection of the ecosystem Baltic Sea.

Additionally, the measurements were focused to investigate the propagation of the Major Baltic Inflow from December 2014 and its impact on environmental conditions in the deep basins of the central Baltic.

The area under investigation covered the Baltic Sea between Kiel Bight and the northern Gotland Sea (Fig. 1). Marine meteorological, hydrographic, hydrochemical and hydrobiological investigations were performed according to the COMBINE program of HELCOM. The majority of stations is located along a SW-NE transect, describing the state in the succession of basins from the western to the central Baltic as main information (Fig. 5). Additional stations from the Bornholm to the Western Gotland Basin were done to investigate a possible western pathway of the saline water intrusion (Fig. 6). The highstand of the inflowing salt water in the Bornholm Basin up to -55 m gave indications that the Middle Bank can be passed for a direct ventilation of the Western Gotland Basin. In the Eastern Gotland Basin additional stations were sampled to get an area-wide overview of the physical, chemical and biological state of suboxic to anoxic conditions before the inflow arrives. The mooring “Gotland central” equipped with sediment traps and hydrographic sensors was recovered and again deployed on 10th February. Four planned sampling stations of the long term observations in the Northern Central Basin and northern part of the Western Gotland Basin were deleted. We got not a permission to sample the Landsort Deep as a key station of this area. The other 3 stations were deleted because of time- and route effectiveness after the bad weather period from 7th to 9th February.

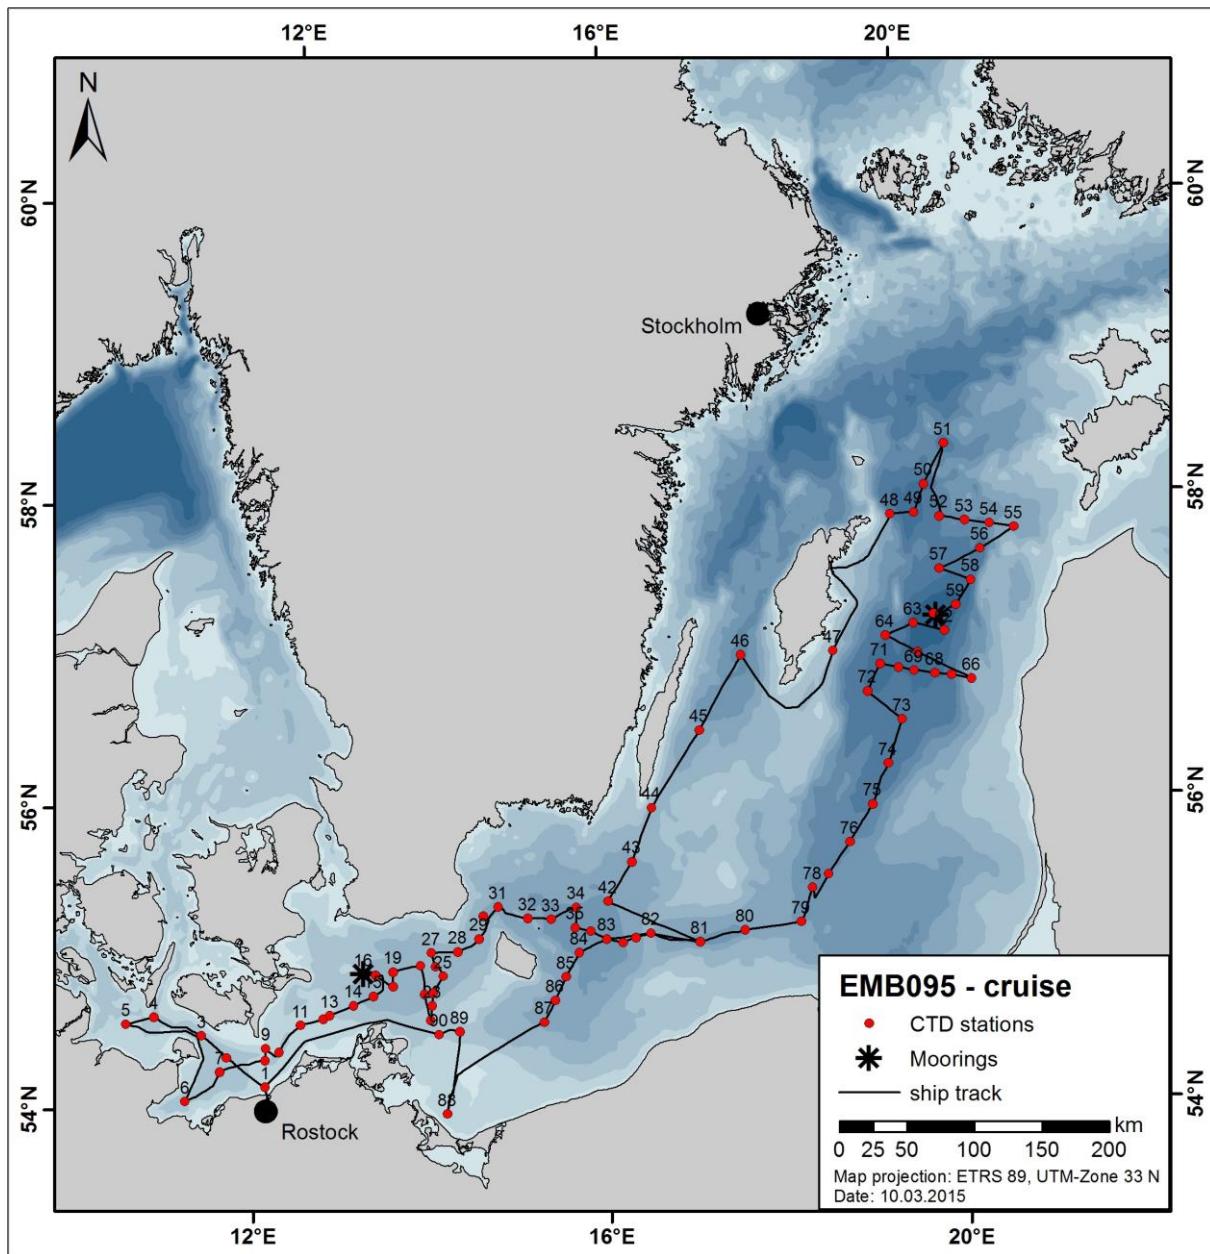

Figure 1: Map of stations and ship track of cruise EMB-095 from 2nd to 14th February. Red dots indicate the position of CTD stations with labels of the station number (Tab. 3).

- The **weather situation** during the cruise was often changing between sunny and calm phases up to bad stormy weather periods. It was influenced by the low pressure cells “Othmar” and “Patrick” moving from the north Atlantic Ocean to northern Europe and an extensive strong Highpressure “Gabriela” of up to 1040 hPa over Ireland moving to central Europe. Air pressure ranged between 990 and 1031 hPa. The Wind speed changed often and ranged between 1 and 9 Bft. Wind directions changed between all directions but nearly 2/3 of the cruise western directions are dominating. Two days of gale with gusts up to 11 Bft from northern direction hampered the work and we had to stay in the harbour of Slite at the northeast coast of Gotland from 7th to 9th February. Air temperature ranged between -1.8 °C (3rd Feb.) in the Mecklenburg Bight up to 7.1 °C (10th Feb.) in the Eastern Gotland Basin.

The following hydrographical and hydrochemical characteristics have been observed during the cruise (cf. Tables 1 and 2, Figures 4 to 8):

- **Surface temperatures** varied slightly between 4.1 °C (Stolpe Channel) and 3.03 °C (Kiel Bight). In all investigated areas of the Baltic Sea, temperatures are well above the long-term mean after a record year of sea surface temperatures in the Baltic Sea (SIEGEL et al. 2015) and so far extreme mild winter 2014/2015 with a cold sum of 15.4 K d at the weather station Warnemünde. The water column is mixed completely down to the halocline (see fig. 5).
- **Deep water layer temperatures** (bottom near depths) increases and decreases slightly in the central Baltic Proper during the last year due to smaller salt water intrusions in spring to summer 2014. Actually the Bornholm Deep is affected by warm bottom water due to the recent inflow of December 2014. At all key stations the temperatures are still higher as the long-term mean. Figure 7 shows the penetration of first inflowing water at the eastern part of the Eastern Gotland Basin with temperatures more than 8 °C, which could be classified as former uplifted bottom water of the Bornholm Basin. In Figure 5 this situation can be seen longitudinal cross section of the basins and pathway of the salt water intrusion.

	Feb 2013	Febr. 2014	Aug. 2014	Febr. 2015	Mean 1971/90
Bornholm D.	5.82 °C	8.65 °C	5.92 °C	7.15 °C	6.1 °C
Gotland Deep	6.41 °C	6.36 °C	6.02 °C	6.71 °C	5.6 °C
Farö Deep	5.98 °C	5.76 °C	5.87 °C	6.17 °C	5.2 °C
Landsort D.	5.58 °C	5.34 °C	5.19 °C	not sampled	4.8 °C
Karlsö Deep	5.29 °C	5.08 °C	5.00 °C	5.03 °C	4.2 °C

- The recent major Baltic inflow from December 2014 is the third largest that have occurred since 1880 and has an estimated inflow volume and salt transport of 198 km³ and 4 Gt (MOHRHOLZ et al. 2015). This event exceeds the former events of 2003 and 1993 and will influence the deep basins around Gotland. After ten years of stagnation this succession of intrusions is documented by a slightly increasing **salinity in the bottom layer** in the central Baltic Proper:

	Nov. 2013	Nov. 2014	Feb. 2015
Gotland Deep	12.07	12.23	12.31
Farö Deep	11.43	11.60	11.81
Landsort Deep	10.43	10.45	not sampled
Karlsö Deep	10.10	9.75	9.78

- Thus, the **oxygen situation in the deep water** of central basins (>100 m water depth) documents this recent inflow activity of 2014 very well. Hydrogen sulphide concentrations (expressed as negative oxygen equivalents) in the near-bottom layer were high in November 2013 as maximum stage of the stagnation period and

decreased drastically in the Eastern Gotland Basin (Gotland Deep, Farö Deep). Northern parts and the Western Gotland Basin are not effected by this intrusions so far, but the high volume of the December event will most probably turn the entire Baltic deepwater conditions from anoxic to oxic, with widespread consequences for marine life and biogeochemical cycles. Figure 5 and 6 visualize the propagation of the inflowing highly saline water from the Bornholm Basin via the Stolpe Sill to the southwestern part of the Eastern Gotland Basin. The thesis of a direct overflow from the Bornholm Basin via the Middle Bank into the Western Gotland Basin cannot be approved, because of more or less constant Hydrogen sulphide values in the Karlsö Deep since November 2013.

	Nov. 2013	Nov. 2014	Feb. 2015
Gotland Deep	-8.75 ml/l	-1.71 ml/l	-0.92 ml/l
Farö Deep	-7.74 ml/l	-2.41 ml/l	-1.07 ml/l
Landsort Deep	-1.32 ml/l	-0.95 ml/l	not sampled
Karlsö Deep	-1.20 ml/l	-1.25 ml/l	-0.86 ml/l

- The **nutrient situation** in the surface layer is typical for the winter season, except in the Lübeck Bight. In this western Baltic area the phosphate and nitrate values are lowered, because the biological production like the diatom bloom has started (table 1).
- In the deep waters of the **central basins** (>100 m water depth), the hydrographic situation is mirrored. The ventilation of the Eastern Gotland Basin since summer 2014 caused decreasing phosphate, ammonium and silicate concentrations (table 2). The values are halved or even more decreased since November 2013. Also silicate concentrations have decreased from 126.8 µmol/l to 54.7 µmol/l since that stage at the Gotland Deep.
- Samples for **phyto- and zooplankton** were collected for later analysis in the laboratory.
- **Additional program:**
One complete depth profile of station TF271 for al longterm data collection of CT, AT, and pH (photospectrometric)(responsible scientist: Dr. B. Schneider)
Equilibrator/sensor system for continuous measurement of CH₄, CO₂, and N₂O in surface waters using off-axis integrated cavity output spectroscopy (responsible scientist: Prof. G. Rehder, Jan Werner).
Water samples for CH₄ and N₂O measurements in different water depths at 12 stations along the cruise track. Part of a Phd work on studies about greenhouse gas conversion in marine systems with distinct oxygen dynamics (responsible scientist: Prof. G. Rehder, Jan Werner).
Filtration of water samples from different water depths at selected stations for analysis of bacterial DNA, RNA and cell numbers (flow cytometry and fluorescence

in situ hybridization) to investigate the impact of the inflow on bacterial communities (Responsible scientists: Prof. K. Jürgens, B. Bergen).

At station TF213 (Bornholm Basin) are additional phyto- and microzooplankton samples taken by WP2 and Apstein nets as well as water samples (responsible scientist: Dr. J. Dutz).

In the Gotland Deep (station TF271) are water samples from the oxic and anoxic water layer taken for a long-term study of redox-sensitive trace-elements such as iron and manganese. The main aim of the study is to assess the impact of the inflow from December 2014 on the concentrations of the dissolved species Fe(II) and Mn(II) (responsible scientist: Dr. D. Meyer).

In the Bornholm and Eastern Gotland Basin are 4 samples (TF213, TF271, TF272, TF285) of sea bed sediments taken to analyse the resettlement of foraminifera due to the impact of the Major Baltic Inflow of December 2014 (responsible scientist: Dr. M. Moros).

At the Gotland Deep (station TF271) a Frahmlot sediment core of the surface sediments up to 1m depth is taken to analyse the concentrations of organic pollutants. For the same task are done watersampling by an in situ pumpsystem in the deep water layer of the Bornholm Deep and Gotland Deep (stations TF213, TF271) (responsible scientist: Prof. D. Schulz-Bull).

For the BONUS project BLUEPRINT are water sampling done at the stations TF12, TF01, ABBOJE, TF245, TF271 and OBBOJE for RNA isolation. The 2 l samples are fixed by a fixative based on phenol-ethanol to keep microbiological contents in situ and stored at -80 °C (responsible scientist: Dr. C. Bennke, PD M. Labrenz).

A mooring was recovered at the FINO-2 platform closely located to the BALTIC 2 offshore windpark installation site at the Kriegers Flak for the IOW/BSH FINO-2 project (responsible scientists: E. Stohr, S. Krüger).

VERANKERUNGSPROTOKOLL

Datum: 10.02.2015 Beginn: 14.10 Ende: 14.40 UTC

Gerät: Gotland - AT - 2015 - 02 Reise EMB 95

Code Name:

Lottiefe: 249

Wetter: Wind: Bft. 3 260°
Strömung: 135° 0,5 kn

Absetzposition: Breite: 57°18,372'N (WGS 84, DGPS)
Gerät Länge: 020°04,750'E

Grundleine: Breite: keine
(Ende) Länge:

Richtung: _____ (vom Gerät)
Länge: _____

Oberfläche: _____

Bemerkungen:

Zijer
Kapitän

Wa
Exp.-Leiter

Verteiler:
