1 Cruise Summary

1.1 Summary in English

EMB286 campaign is the first one in a series of five cruises to study the spatial and temporal variations of the Baltic Sea ecosystem by numerous hydrographic, chemical and biological parameters. It is conducted in the frame of the COMBINE Programme of the Helsinki Commission (HELCOM) as well as measurements outside the German territorial waters for the IOW's long term data programme, performed since 1969. The data acquired are used for the regular national and international assessments of the state of the Baltic Sea, and provide the scientific basis for measures to be taken for the protection of the ecosystem Baltic Sea.

During this expedition 53 CTD casts were measured from the western to the central Baltic Sea. Water sampling at discrete depths was done for measuring numerous parameters of nutrients and pollutants, as well as extraction of phytoplankton and zooplankton samples. Along the transects roughly 300 l surface water were filtered for analysing organic pollutants. Sediment sampling of the uppermost 3-5 cm was done at selected stations in the German EEZ for analysis of organic contaminants.

The cruise was carried out under windy conditions, 9 out of 12 days with more than 6 Bft. Over two days the ship hid between Sweden and Oeland Island waiting for the weather/sea conditions to improve. Because of the forecast after the work interruption the ship headed towards Rostock and only the repeat stations were occupied. The cruise terminated in the evening of 16th february, one day earlier than scheduled.

1.2 Zusammenfassung

Die EMB286 Messkampagne ist die erste in einer Serie von fünf Fahrten zur Untersuchung der räumlichen und zeitlichen Veränderungen des Ökosystems der Ostsee anhand zahlreicher hydrographischer, chemischer und biologischer Parameter. Sie wird im Rahmen des COMBINE-Programms der Helsinki-Kommission (HELCOM) sowie im Rahmen von Messungen außerhalb der deutschen Hoheitsgewässer für das Langzeitdatenprogramm des IOW durchgeführt, das seit 1969 läuft. Die gewonnenen Daten werden für die regelmäßige nationale und internationale Bewertung des Zustands der Ostsee genutzt und bilden die wissenschaftliche Grundlage für Maßnahmen zum Schutz des Ökosystems Ostsee.

Während der Expedition wurden 53 CTD-Profilen von der westlichen bis zur zentralen Ostsee ausgehend gemessen. Es wurden Wasserproben in verschiedenen Tiefen entnommen, um den Gehalt an Nähr- und Schadstoffen zu messen und Proben von Phytoplankton und Zooplankton zu gewinnen. Entlang der Schnitte wurden etwa 300 l Oberflächenwasser für die Analyse organischer Schadstoffe gefiltert. An ausgewählten Stationen in der deutschen AWZ wurden Sedimentproben aus den obersten 3-5 cm für die Analyse organischer Schadstoffe an ausgewählten Stationen entnommen.

Die Fahrt fand unter windigen Bedingungen statt, an 9 von 12 Tagen mit mehr als 6 Bft. Zwei Tage lang hielt sich das Schiff zwischen Schweden und der Insel Oeland auf, um auf eine Verbesserung der Wetter-/Seebedingungen zu warten. Aufgrund der Vorhersage nach der Arbeitsunterbrechung steuerte das Schiff Rostock an und nur auf den Wiederholungsstationen wurden gemessen. Die Reise endete am Abend des 16. Februars, einen Tag früher als geplant.

3 Research Program

3.1 Description of the Work Area

The investigation area of the cruise EMB286 covered the western and central Baltic from the Kiel Bight to the northern Bornholm Basin (Fig. 3.1). The majority of stations is located along the talweg transect of the Baltic Sea, describing the hydrographic conditions in all basins on the pathway of saltwater inflows from the North Sea (Fig. 3.1; Fig. 5). These inflows are the sole source for ventilation of the deep basins.

3.2 Aims of the Cruise

The performed meteorological, hydrographic, chemical and biological sampling and measurements lead to an assessment of the actual winter situation of the Baltic Sea ecosystem from Kiel Bight to the northern Bornholm Basin. In the frame of the COMBINE Programme of the Helsinki Commission (HELCOM), national monitoring demands and scientific interest in long-term variations /trends (IOW's long-term data programme 1969-present), the acquired data will be used for regular national and international assessments of the state of the Baltic Sea (e.g. HELCOM 2018), and used in numerous publications, as well as will provide the scientific basis for measures to be taken for the protection of the ecosystem Baltic Sea.

3.3 Agenda of the cruise

The measurements in the western Baltic Sea during this cruise, were done on behalf of BSH as the German contribution to HELCOM (see also section 3.2). IOW runs five cruises each year for the annual Baltic Sea environmental assessment. EMB286 was the first cruise in 2022, whereas the stations along the talweg in the central Baltic Sea (Fig. 3.1) contribute to the long term data collection of the IOW.

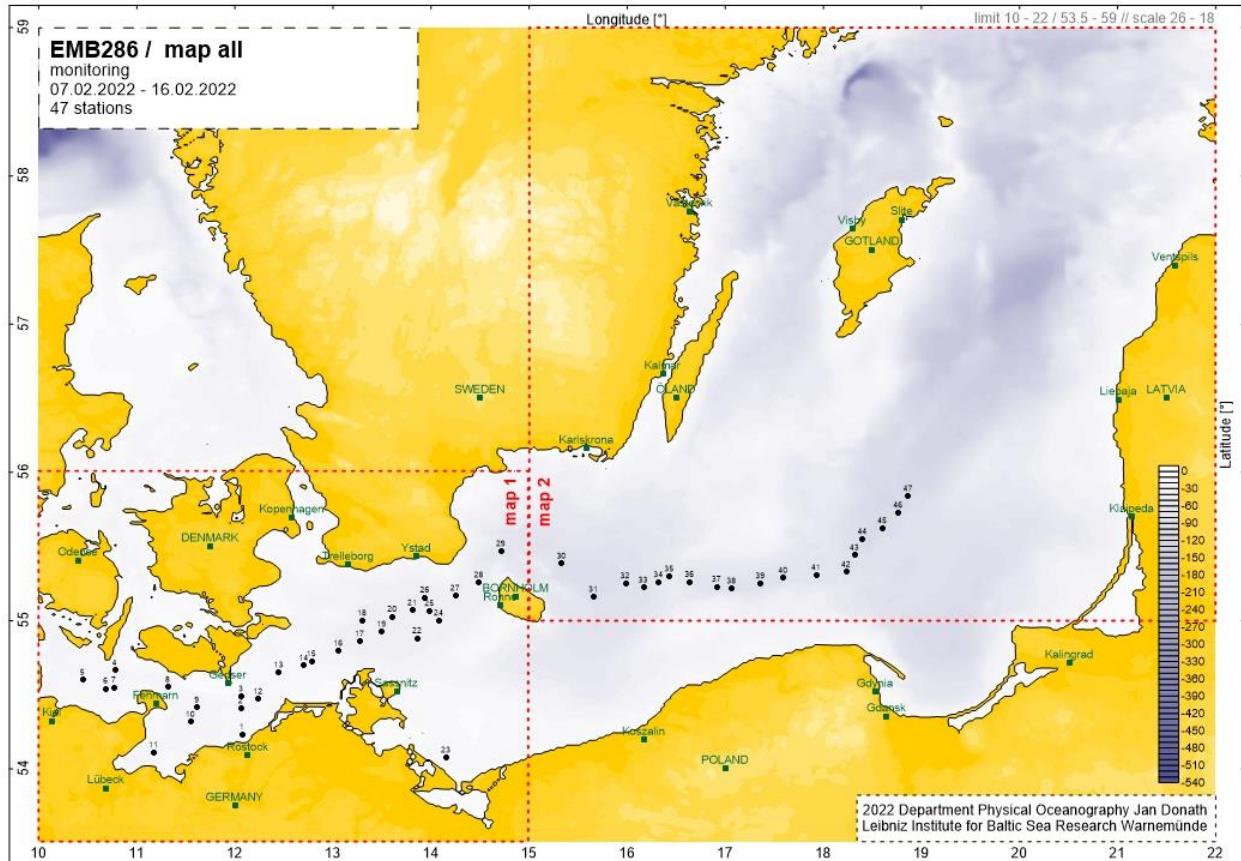

Fig. 3.1 Track chart of R/V Elisabeth Mann Borgese of cruise EMB286 including the occupied stations where CTD and MUC were deployed.

4 Cruise Narrative

Loading of equipment and the embarkation of the cruise participants took place on 7th of February 2022, with an early start at 7:30 at IOW. On arrival at the ship in Rostock-Marienehe first all participants had to take a Covid test, before being able to start working. After safety instruction late afternoon, the EMB departed from Rostock-Marienehe at 18:00 local time.

The ship headed towards Mecklenburg Bight, the weather forecast was moderate, 5-6°C, cloudy and westerly winds of 6 Bft, in gusts reaching 7 Bft. The station work started at station TF005, followed by TF0040 and TF0040 in the early evening hours. During the night to 08.02.2022 and during the day a number of stations in the western Baltic Sea (TF361, TF360; TF0010, TF0011, TF0012, TF0022, TF0046) was occupied, where hydrographic, phyto/zooplankton sampling and coring continued. 2 MUCs were taken close to Fehrmann (Fig. 3.1).

Initially the working conditions were good on 9th of February, but at station TF0069 the MUC was not deployed, as the sea conditions worsened (2 m waves). During the day winds were 7-8 Bft. We continued with the hydrographic work and arrived at station TF0113 at midday, continued with TF0104, TF0105 and ABBoje as well as ABBoje. On the next day (10.02.2022) EMB entered

the territorial waters of Denmark (TF0200, TF0214, TF 0213, TF 0221, TF 0225 and TF 0226). At night we entered the polish waters and work at several stations (TF0227, TF0229, TF0222, TF0266, TF0267, Tf0268, TF0256, TF0257, TF0259, TF0255, TF0258, TF0253).

The weather and sea conditions changed drastically during the day and the weather forecast did not promise any improvement. In contrary the weather/sea were expected to get worth (more than 8 Bft, and 3 m waves in the Gotland Basin), therefore we decided to hide and wait for improved conditions. Station work was terminated at station TF0253 in the afternoon on 11th February, and EMB headed close to the Swedish coast. There was no station work from afternoon 11th to 13th of February, actually until 14th of February midday. On 14th of February (12:00 UTC) we decided to head to station TF0213 and resume work. Station TF0213 was occupied on 15.02.2022 at 3 pm, we continued with TF0113, TF0030 till midnight. In the early morning on 16.02.2022 the last two repeated stations TF0045 and TD0012 were occupied and the station work terminated. EMB arrived in Rostock at 2 pm on 16th of February, and we started with cleaning the laboratories as well with packing the gear. From 8:00 in the morning to 10:45 (both local time) the loading of the gear into container and cars was carried out. The participants disembark and the cruise finished (Fig. 3.1).

5 Preliminary Results

The results presented in the following section are preliminary and not comprehensive. CTD data is quality checked and validated. The aim of this section is to give a first impression on the collected data set. An advanced data analysis will be integrated following the complete validation of the data set.

The vertical temperature and salinity distribution along the “Talweg” based on the sampled stations until the northern Bornholm Basin is shown in Fig. 3.1. The western part of the transect until Arkona Basin is occupied by water of 5°C in the entire water column and fully mixed. In the Bornholm Basin from a bottom to roughly 20 m above the seabed water with higher temperatures (up to 9°C) was observed. The water column was mixed down to 60 m in the deeper areas along the transect. High salinity (~25) was seen in the shallow western part, especially in the Mecklenburg Bight, there is further towards East indication of flow of high salinity water near to the bottom. In the Arkona Basin salinity of ~15 was observed close to the bottom, whereas in the Bornholm Basin salinity below 10 was measured (Fig. 5.1).

Dissolved oxygen concentrations measured along the “Talweg“ are high in the entire water column, apart from the deep regions in the Bornholm Basin (Fig. 5.1), with concentrations between 9 ml/L at surface and 4 ml/L at 60 m. Close to the bottom in the Bornholm Basin depleted concentrations and at some stations H₂S was measured.

5.1 Oxygen situation in the deep water

The oxygen situation in the deep waters (>60 m water depth) show the ongoing stagnation period, which started after the phase of several ventilations due to the inflow events 2014-2017. There is no indication for new ventilation events. Hydrogen sulphide concentrations (expressed as negative oxygen equivalents) in the near-bottom layer were measured in the Bornholm Basin. In addition, figure 5.1 and 5.2 visualize the situation at stations sampled on this cruise along the “Talweg”. At depth below 70 H₂S was detected with concentration up to -1.3 ml/L in the Bornholm Basin. An overview of measured bottom near values of dissolved oxygen and/or H₂S at key stations is shown in figure 5.1.

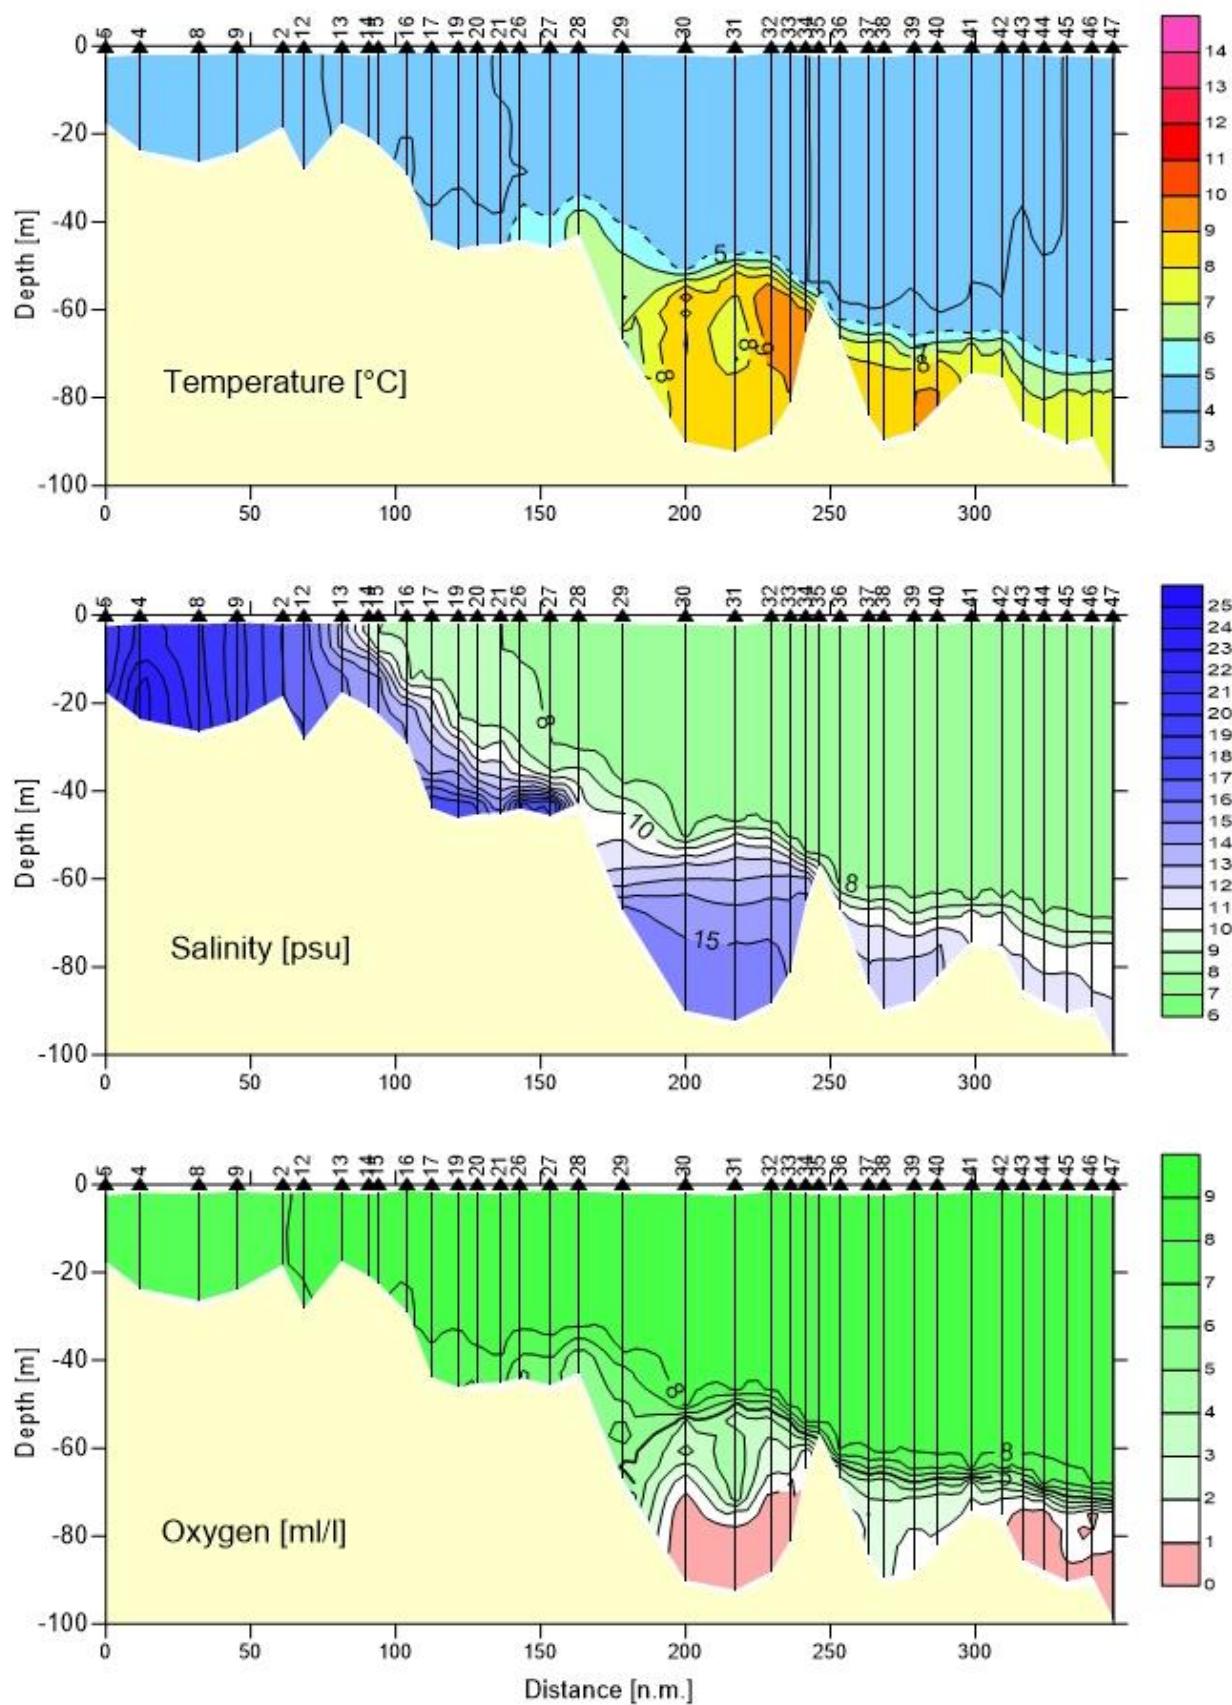

Fig. 5.1 Temperature, salinity and dissolved oxygen measured during EMB286.

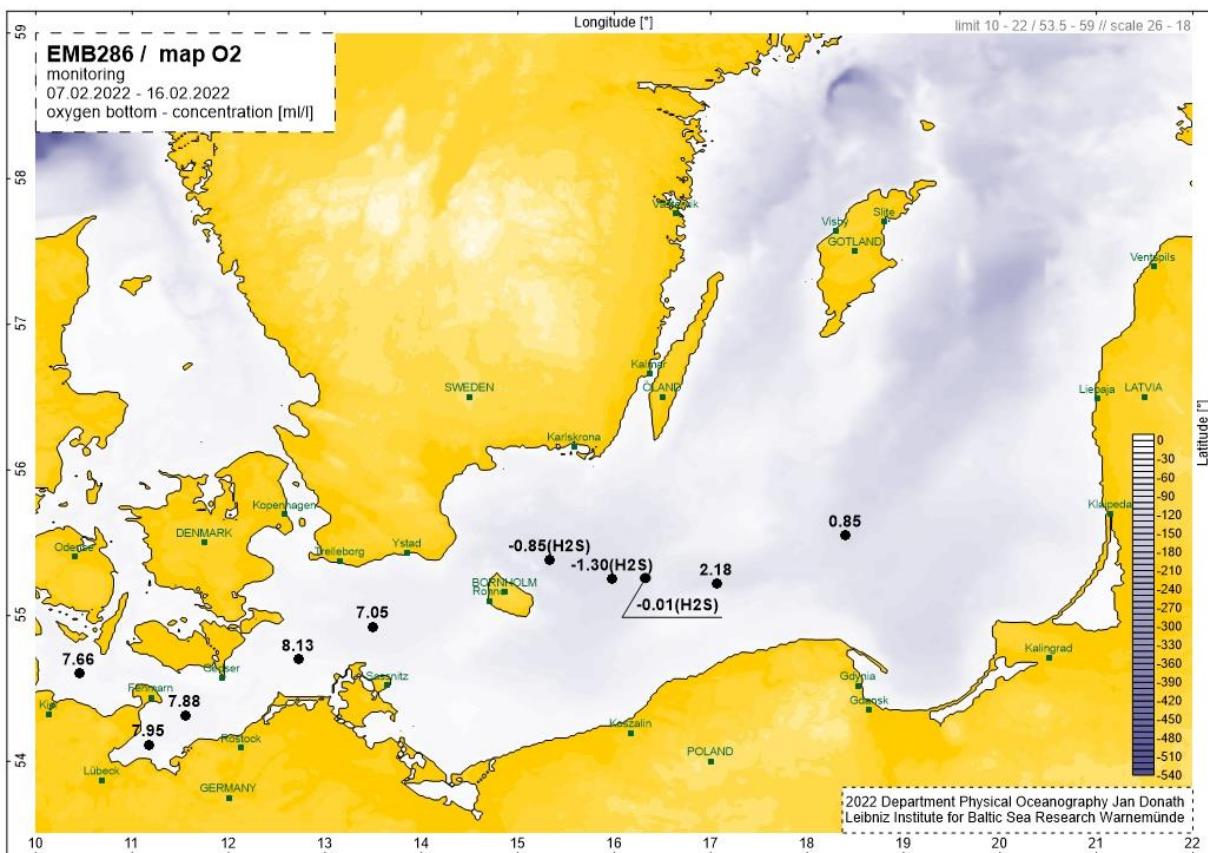

Fig. 5.2 Dissolved oxygen/hydrogen sulphide conditions in the bottom near layer for selected key stations (hydrogen sulphide was converted into negative oxygen equivalents).

5.2 Nutrient situation

The nutrient situation in the water column layer is typical for the winter season. In all key areas phosphate and nitrate values are on a high winter level, because the biological production did not start yet. There is no indication for end of the stagnation period in the deep basins, and no sign for ventilation of the basins by waters from the North Sea. H₂S occurred in Bornholm Basin (Fig. 5.2) in the 20 m above the sea bed.

* Hydrogen sulphide was converted into negative oxygen equivalents; n.d. – no data/not determined

5.3 Additional sampling

Samples for phyto- and zooplankton as well as dissolved gases were collected for later analysis in home laboratory.

6 Ship's Meteorological Station

The weather conditions were harsh during the cruise influenced by a series of low pressure cells crossing northern Europe. The first 4 days (7-11.02) were characterized by wind between 6 and 7 Bft allowing for station work. The station work was interrupted on 11.02.2022 and we hided close to Sweden. On 13th of February weather conditions improved allowing to continue station work. However, the approaching extreme storms from NW forced the ship to head towards Rostock.

7.4 Station List – sediment sampling

Date 2022	Latitude [decimal]	Longitude [decimal]	Station Name	Station No.	Time UTC	Water Depth [m]	Sediment samples
08.02.	54. 5516 N	11.32 E	TF0010	8	15:15	28	MUC, 0-2cm
08.02.	54°18.9080N	11°32.9912E	TF0012	10	19:05	24	MUC, 0-2cm
09.02.	54°04.5319N	14°09.2645E	OB Boje	23	23:45	15	MUC, 0-2cm
15.02.	55°00.0002N	13°18.0184E	TF0069	18	17:25	47	MUC, 0-2cm
08.02.	54°32.9336N	10°46.1938E	FeMa1	7	09:00	23	MUC, sliced
08.02.	54°32.4989N	10°41.1808E	FeMa2	6	23:45	23	MUC, sliced

8 Data and Sample Storage and Availability

Data is intensively validated and will be freely available in the IOW DB by the online search and data download tool ODIN2 (<https://odin2.io-warnemuende.de/#/>). Afterwards the data will be imported into national and international databases (MUDAB, HELCOM, ICES).

Tab.8.1 Overview data availability. Monitoring data are automatically transferred to MUDAB, HELCOM, ICES from ODIN as soon as available there. * all data is available on request at any time.

Type	Database	Available	Free access	Contact
CTD data*	ODIN	Sep 2022	Sep 2022	michael.naumann@io-warnemuende.de
Nutrients*	ODIN	Sep 2022	Sep 2022	joanna.waniek@io-warnemuende.de
Plankton*	ODIN	Sep 2022	Sep 2023	anke.kremp@io-warnemuende.de
Sediments	ODIN	Sep 2022	end 2024	detlef.schulz-bull@io-warnemuende.de
