1 Cruise Summary

1.1 Summary in English

The monitoring is carried out in the framework of the COMBINE Program of the Helsinki Commission (HELCOM), of the Bund-Länder-Messprogramm (BLANO) and of the long-term data program of the IOW. A series of regular short-term cruises are conducted by the Leibniz Institute for Baltic Sea Research (IOW) that serve to monitor the hydrographic, chemical and biological situation in the western, central and northern Baltic Sea. The results provide the scientific basis at the assessment of the environmental state of the Baltic Sea and for the understanding of climatic and anthropogenic forcing of environmental changes.

The cruise in August investigates the summer conditions, especially regarding the extent of cyanobacteria blooms. During the expedition, research was conducted at 113 stations from the western Baltic Sea to the northern Baltic Sea via the major Basins. Despite the interruption of the station work due to bad weather conditions, the full planned program was achieved. At selected stations, nutrient concentrations and various biological parameters describing the phyto- and zooplankton taxonomic composition and abundance were determined. The results show that the surface water temperature was very warm and above the long-term average. The salinity distribution was typical with higher values in the bottom water of the western Baltic Sea. A small inflow of warm water was recorded in the western Bornholm Basin. Additional samples were taken for UV-filter substances, eDNA bioarchives and for the determination of radionuclides.

1.2 Zusammenfassung

Die Reise EMB346 erfolgte im Rahmen des COMBINE Programms der Helsinki Kommission (HELCOM), des Bund-Länder-Messprogrammes Nord- und Ostsee (BLANO) und des Langzeitprogramms des Leibniz Institut für Ostseeforschung in der zentralen Ostsee. Sie ist Teil von fünf jährlich durchgeführten Fahrten und beschreibt die hydrographische, chemische und biologische Situation in der westlichen, zentralen und nördlichen Ostsee. Die Daten bilden die Basis zur Erforschung des langzeitlichen Einflusses von Klimaveränderung und anthropogener Aktivität auf die Ökosystemdynamik und den Umweltzustand der Ostsee.

Die Beprobung erfolgte auf insgesamt 113 Stationen entlang eines Schnittes von der Kieler Bucht in die zentrale und nördliche Ostsee und diente der Erfassung der Situation während der Sommermonate mit besonderer Berücksichtigung von Cyanobakterien-Blüten. An ausgewählten Stationen wurden daher Proben zur Nährstoffverfügbarkeit und zur Beschreibung der Zusammensetzung und Abundanz der pelagischen Gemeinschaften (Phyto- und Zooplankton) gewonnen. Trotz einiger Unterbrechung der Arbeit aufgrund schlechter Wetterbedingungen konnte das volle Fahrtpogramm absolviert werden. Erste Ergebnisse weisen auf eine Stagnationsphase hin. Kleine, warme Einströme wurden im Bornholmbecken und dem südlichen Gotlandbecken beobachtet, die jedoch keinen Einfluss auf die Bedingungen im Tiefenwasser hatten. Das Oberflächenwasser war außergewöhnlich warm. Neben dem regulären Programm wurden Proben zur Bestimmung von UV-Filtersubstanzen oder Radionukliden gewonnen und die im Frühjahr begonnen Arbeiten zur Erstellung eines eDNA Bioarchives fortgesetzt.

3 Research Program

3.1 Description of the Work Area

The area under investigation of the cruise EMB346 covered the western and the central Baltic from the Kiel Bight to the northern Gotland Basin. The majority of stations were located along a transect that aims at describing the hydrographic conditions in all basins on the pathway of saltwater inflows from the North Atlantic and the change in biodiversity associated with the gradient in salinity from mesohaline to oligohaline surface water (Hernroth & Ackefors 1979). The deep inflows are the sole source for ventilation of the deep basins (Matthäus et al. 2008).

3.2 Aims of the Cruise

The cruise contributes to the international environmental monitoring program of the Helsinki Commission (HELCOM) carried out by the Leibniz-Institute for Baltic Sea Research in Warnemünde (IOW). Within the German Exclusive Economic Zone (EEZ), monitoring is conducted on behalf of the Federal Maritime and Hydrographic Agency (BSH). In the central Baltic Proper, long-term data is collected by the Leibniz Institute for Baltic Sea Research Warnemünde (IOW). The monitoring program was initiated in 1979 and run by the IOW's predecessor institute and is continued by the IOW since 1992 in the framework of the COMBINE Program of the Helsinki Commission (HELCOM). The acquired data will be used for the regular national and international assessments of the state of the Baltic Sea (e.g. HELCOM 2018) and the assessment of long-term trends in the hydrographical and biological data.

The summer cruise is of particular scientific interest for the study of the distribution, abundance and impact of cyanobacteria blooms in the western and the central Baltic Sea. With regard to eutrophication effects and the impact of climatic change on the pelagic ecosystem, their effect in combination with the expected annual temperature maximum and potential heatwaves as further stressors of the dynamics and production of the heterotrophic zooplankton compartment is of particular interest.

Additional program:

- In the framework of the Create Project, sampling for the establishment of an eDNA Bioarchive and for proteomic investigations were conducted (responsible scientist: Dr. Norma Welsch, UGW, Prof. M. Labrenz, IOW)
- Sampling for the identification of accumulation areas for UV-filter substances (Dr. M. Kanwischer, IOW)
- On various stations, a new system for the measurement of seawater alkalinity was tested (Prof. G. Rehder, IOW)
- Samples for the determination of radionuclides were taken taken on behalf of the BSH (Dr. S. Schmied, BSH)
- In the framework of the Interreg Project EMPEREST, sampling for per- and polyfluoride Alkyl-substances (PFAS) in the water of the western Baltic Sea was conducted (Dr. M. Kanwischer, IOW)
- For the analysis of the long-term changes in the population dynamics of key copepod species in the Bornholm Basin, zooplankton nets (Apstein, mesh size 50 µm, WP-2 mesh size 100 µm) were deployed to quantitatively sample nauplii and copepodites (responsible scientist Dr. J. Dutz, IOW).

3.3 Agenda of the Cruise

The cruise had various foci and goals. First, the work enclosed the environmental monitoring program in the western Baltic Sea (Kiel Bight-Arkona Basin, Fig. 3.1, map 1). The second focus was the IOW's Baltic Sea long term observation program in the central Baltic Sea (Fig. 3.1, map 2), that included sampling along the Thalweg-stations. Finally, high-resolution observations of the hydrographic situation perpendicular to the Thalweg-transect were done in the eastern and the western Gotland Sea. Data acquisition was carried out using the following devices and measuring platforms. At stations and transects the CTD SBE 911+ with rosette water sampler

(CTD), the towed ScanFish (SCF), Secchi disk, phytoplankton- and zooplankton nets were deployed. In addition, continuous underway measurements of the surface water properties and seawater pH were done. An overview of the sampled stations is provided in Fig. 3.1 and Table 7.1. Responsible marine research conducted regarding sampling and use of biological material. Pelagic sampling limited to the needs for analyses and experiments. Nets were carefully rinsed with freshwater in between net hauls to avoid transfer of organisms to non-native areas.

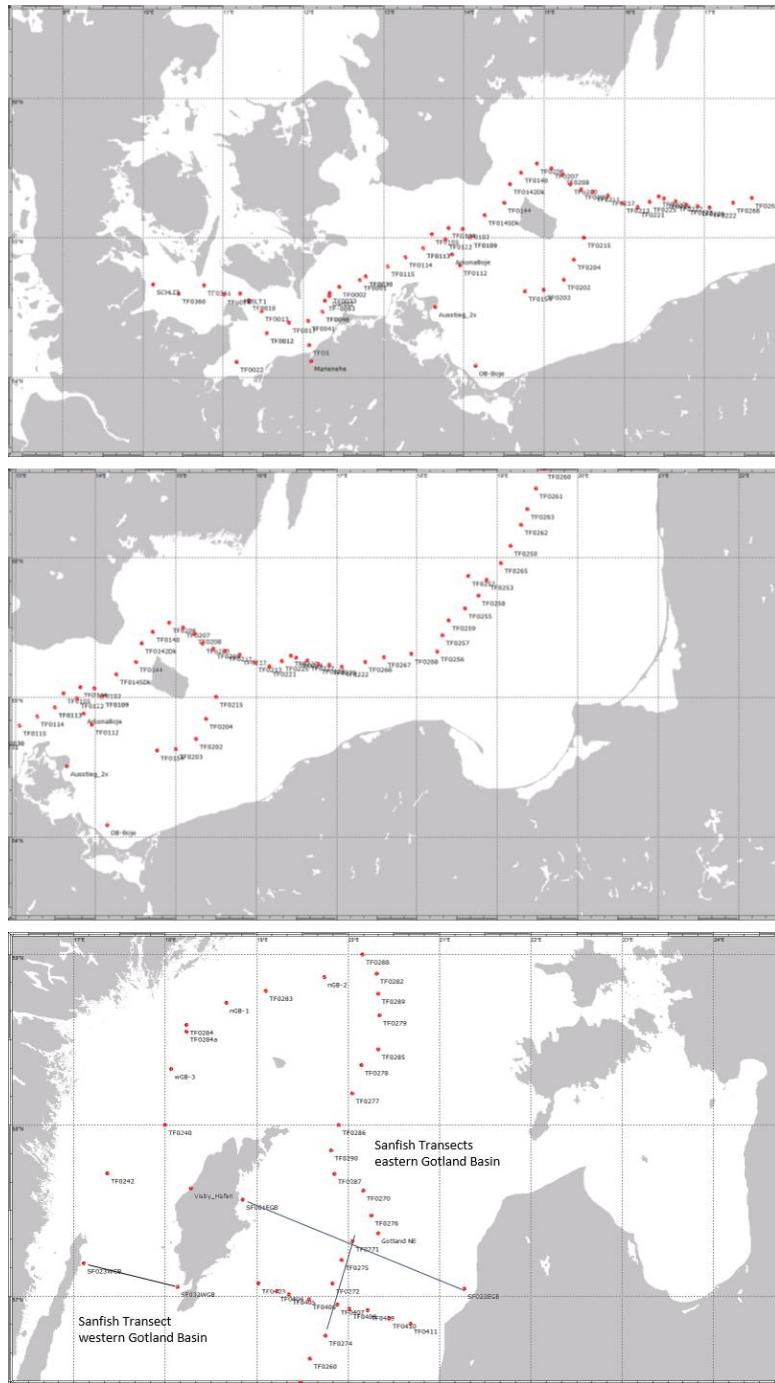

Fig. 3.1 Track chart of R/V ELISABETH MANN BORGESE Cruise 346. Upper panel: stations in the western Baltic Sea including the Kiel Bight, the Bay of Mecklenburg and the Arkona Basin, mid panel: stations in the southeastern Baltic Sea including the Bornholm Basin and the southern Gotland Basin, lower panel: stations in the northeastern Baltic Sea including then northern Gotland Basin.

4 Narrative of the Cruise

The preparation for the cruise EMB346 started with the loading of the equipment and the installation of sampling devices during the 5th of August from 07:30 to 19:00. Four scientist spend the night on board EMB. The rest of the scientific crew was embarking in the morning of the 6th of August at 07:30. Following the safety instructions, RV ELISABETH MANN BORGESE left the harbor at 09:00 in the morning at sunny, calm and already very warm weather (wind 2.7 m/s E, air temperature 20.1°C, pressure 1014.3 hPa). Shortly after the ship passed by Warnemünde, the first station was reached (TF05, 10:00). Here, the CTD was successfully tested and water samples for the analyses of eDNA, proteomics and the identification of chemical UV-filter enrichment areas were taken. Large patches of cyanobacteria were visible on the surface.

After a short tribute horn blow at the sea funeral of a former colleague of the IOW, EMB started to sail direction Fehmarn Belt and Kiel Bight where the next stations were located. In between two CTD casts at TF0010 and TF0361, the ship had a short stop in the Fehmarn Belt (FBELT 1) to take samples for the measurement of radionuclides at station. In the early evening, hydrographical and chemical conditions were determined at station TF0360 in the Kiel Bight. Additional samples were taken for the analysis of the phyto- and zooplankton composition later in the laboratory. In the evening, RV ELISABETH MANN BORGESE sailed further westwards for another radionuclide sample (station SCHLEI). Then, we turned eastwards where the hydrographical measurements continued along the ‘Thalweg’ into the Bay of Mecklenburg during the night (TF0014, TF0013). During the first day, weather was sunny with air temperatures above 20 °C, while the wind stayed calm (5.3-9.0 m/s, E-SE).The hydrographical measurements during the first day indicated that the surface water temperature was high and were close to 20°C at all stations.

During the 7th August 2024, sampling continued in the Bay of Mecklenburg. Samples for the measurements of UV-filter substances were taken at the southernmost station in the Lübeck Bight (TF0022). The program continued with two stations including diverse sampling for fungi, phytoplankton and zooplankton biodiversity (TF0012, TF0046) and a series of hydrographical stations (TF0017, 0041, 0083, 0033, 0002). At several of these stations, samples for UV substances, proteomics and e-DNA were also taken. The warm weather with calm wind (air T >20°C, 3-4 m/s, E) continued. The water temperature was still close to 20°C and large areas covered with dense cyanobacteria aggregates at the surface were observed that reflected the low salinity in the surface water. In the evening, our station at the Darss Sill was reached (TF0030) and sampling of the hydrography, chemistry and biodiversity continued into the Arkona Sea during the night and early morning (TF115, 114, 113, 104, 103, 109). The water temperature was still close to 20°C at the surface; the larges aggregates of cyanobacteria at the surface disappeared, but their concentration in the water column was still high making net sampling difficult.

In the morning of the 8th August 2024, we sailed to Sassnitz for a crew exchange after the finishing of hydrographical and biochemical measurements at station TF0112. The teams taking samples for measurements of UV- filter substances, proteomics and e-DNA left the ship, and one member of the CTD team was exchanged. RV ELISABETH MANN BORGESE sailed back to the Arkona Sea where the series of hydrographical and chemical measurements continued over the Bornholm Gatt into the Bornholm Basin overnight and in the morning of the 9th August

2024 (TF0145DK, 144, 142, 140, 206, 207, 200, 209, 212). While the weather was still warm (20°C), the wind already increased and changed the direction from east-southeast to west. Due to the approaching front with winds of larger than 15 m/s and wave heights of 2.5 m, it was decided to leave the schedule sampling programme direction east and sail instead northwards to find shelter and proceed the cruise in opposite direction (around Gotland and then southwards in the eastern Gotland Basin). Nevertheless, we managed to sample station TF213 in the central Bornholm Basin. In addition to the regular measurements of hydrographical and chemical conditions, plankton samples were taken for monitoring purposes. In addition, several Apstein (50 μm) and WP-2 (100 μm) nets were taken to support the analysis of the long-term changes in the population dynamics of key copepod species in the Bornholm Basin by quantitative samples for nauplii and copepodites. RV ELISABETH MANN BORGESE left the Basin after the sampling at 14:00 and headed northwards close to Oland in the western Gotland Basin. The ship arrived there at the 10th of August in the early morning and stayed on the position until the bad weather had passed ($57^{\circ}14,70'\text{N}$; $17^{\circ}11,43'\text{E}$).

The work resumed in the morning of 11th August with the western Gotland Basin Scanfish transect when the weather had sufficiently calmed down. Strong wind was still blowing from west (10-15 m/s); the air temperature dropped to 15.8°C while the surface water was still warm ($>18^{\circ}\text{C}$). The Scanfish transect started with a CTD cast at station SF025WGB and was directed eastwards to the southernmost tip of the island of Gotland. The deployment stopped at 13:30 and RV ELISABETH MANN headed north to resume the CTD measurements along the Thalweg. Strong winds (12.6 -13.1 m/s, west) prevailed and air temperatures rose to 19.2°C . During the night, stations TF0242, Tf0240 and wGB-3 were sampled for hydrographical parameters.

In the early morning of the 12th August 2024, intense hydrographical, chemical and biological measurements were started at station TF0284. In total four CTD casts were performed for vertical profiles of temperature, salinity, oxygen, hydrogen sulfide, pH, CO₂, turbidity, phytoplankton and Chla. At the redoxcline, additional samples were taken for molecular work. Work was finished at noon, and RV ELISABETH MANN continued the sampling along the Thalweg in the northern part of the Gotland Basin during the rest of the day and the night (nGB-1, TF0283, nGB-2, TF0288, TF0282, TF0289). During the day, the wind was blowing from northwest (6.9-7.4 m/s) and the weather was sunny with few clouds only (19.1°C , 1011.2 hPa). In the night, the scientific crew witnessed incredible northern lights and a dozen of shooting stars (see attachment).

The day of the 13th August started with ideal weather for the continuation of the program. The eastern Gotland Basin got increasingly under the influence of a high-pressure cell from the west. The wind decreased to 3-4 m/s (NW), it was sunny and the air temperature was already 18.3°C in the morning. RV ELISABETH MANN continued the sequence of CTD casts along the Thalweg direction south: TF0279, TF0285, TF0278, and TF0277. The vertical profiles on these stations showed a perfect sequence of a mixed surface layer with temperatures around 18° that was sharply separated from the colder intermediate layer and the anoxic deep water. In the afternoon, we continued the sequence of CTD casts and some additional water bottles for comparison of the oxygen sensors with the determination by the Winkler method at stations TF0268, TF0290, TF0287, TF 0270, TF0276 and Gotland NE.

In the night to the 14th of August, intense hydrographical, chemical and biological measurements were started at station TF-0271. In total six CTD casts were done for the vertical

profiles of temperature, salinity, oxygen, hydrogen sulfide, pH, CO₂, turbidity, phytoplankton and Chla. At the redoxcline, samples were taken for molecular work. The first results showed an deepening of the redoxcline from 80 m to 120 m in comparison to the northern Gotland Basin. This deepening is probably related to the last larger inflow of oxygen rich water into the Baltic Sea in winter. Station work was finished in the late morning, and RV ELISABETH MANN sailed further south to perform more CTD casts at stations TF0275, and TF0272. In the afternoon, the program was changed from a Scanfish transect to a series of CTD casts along a transect perpendicular to the Thalweg. This was done in order to investigate the change of the redoxcline depth in more detail (TF403 to 411). The calm weather persisted throughout the day although it got more cloudy and wind changed direction from north to south in the evening (18.3-19.2 °C, 1.7-3.4 m/s, 1018.6 hPa).

On the 15th August, two Scanfish profiles were conducted during the day and overnight. The first one was provided the detailed vertical structure and the position of the redoxcline in a south to north transect (station TF0274 to station TF0271, 01:58-08:25). The second transect was again perpendicular to the Thalweg north of the first transect (SF022EGB to SF001EGB,). Both transects lasted the whole day until the morning of the 16th. The morning started already with warm temperatures (19.8°C) and moderate winds from southeast (7.8 m/s, 1015.0 hPa). The wind changes to southwest direction in the turn of the day (7.3-7.8 m/s, 21.8°C, 1014.0 hPa).

In the morning of the 16th August 2024, RV ELISABETH MANN sailed for the small town of Slite at the east coast of Gotland to bunker fresh supplies. Work resumed in the afternoon when we sailed southwards to station TF0260 to resume the work on the Thalweg. In the night, CTD casts and measurements of bottom water oxygen/hydrogensulfide concentrations were done at stations TF0261, 0262, 0250, 0265 and continued during the morning of the 17th August 2024 at stations TF0253, 0252, 0258 and 0255. While the wind directions has further changed to west-northwest and increased from 4.6 to 7.3 m/s, the working conditions remained favorable with warm temperatures and sunny-cloudy conditions (19.1°C, 1011.0-1014.3 hPa). During the night and morning, dense aggregations of the moon jelly (*Aurelia aurita*) could be seen in the water of the southern Gotland Basin. Around noon, two additional stations were done with CTD casts and plankton nets (TF0259, 0257) before RV ELISABETH MANN turned westwards for hydrographical measurements along the Slupsk Channel (TF0256, 0268, 0267, 0266, 0222) and the eastern Bornholm Basin (TF0229, 0228, 0227, 0224, 0226, 0225 and 0221) during the evening and the night.

Station TF0213 was reached in the morning of the 18th August 2024. The sampling program included hydrographical, chemical measurements and plankton sampling with the WP-2 and Apstein nets to again support the long-term analysis of population dynamics of key copepod species in this basin. The weather conditions were still favorable with moderate winds and warm temperatures (19.4°C, 1009.1 hPa, 7.2-8.0 m/s, cloudy). The abundance of *Aurelia aurita* has obviously declined, although the species was regularly seen in the telemetry unit of the CTD and from the ship. Before lunch, RV ELISABETH MANN BORGESE turned southwest to determine the hydrographical conditions in the southern Bornholm Basin (TF0215, 0204, 0154) and to take samples for the identification of chemical UV-filter and their concentration close to the Oder estuary, which turned out to be a hot spot for these substances in previous cruises in the evening. This station could not be sampled in the beginning of the cruise due to bad weather conditions.

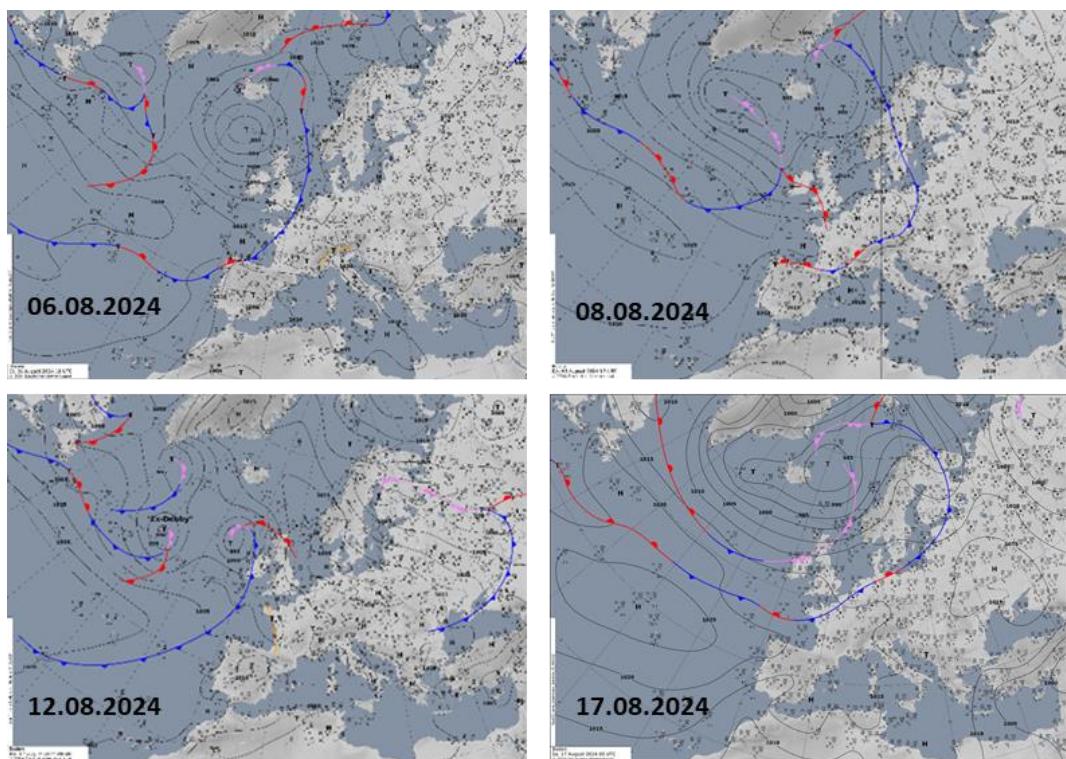

Fig. 5.1 Weather conditions during the cruise EMB346 on the 06.08.2024, 08.08.2024, 12.08.2024 and 17.08.2024. All figures provided the Deutscher Wetterdienst (www.dwd.de).

In the night, RV ELISABETH MANN BORGESE sailed north to the Arkona Sea. Here, the measurements for the BSH were resumed at stations TF109, TF0113, TF001: At Station AB-Boje, a CTD profile was taken in comparison to the long-term mooring anchored at this station. Afterwards, the station work continued at station TF0030, TF0064 and TF0012. These were the last stations with STD measurements and sampling for Chla and zooplankton. After finishing at station TF0012, RV ELISABETH MANN BORGESE returned to the harbor in Rostock-Marienehe, where the ship arrived at 08:00 in the morning of the 20th August 2024.

The unloading of the scientific equipment took place directly afterwards.

5 Preliminary Results

The following results are only preliminary and not comprehensive, since they are based in most cases on unevaluated raw data or are descriptive. Their presentation aims at providing a first overview and general evaluation of the hydrographic and chemical data. A final assessment requires the advanced analysis of data and samples and their validation

5.1 Meteorological Conditions

A high-pressure cell located in the western Baltic Sea determined the weather conditions during the beginning of the cruise (Fig. 5.1). The weather was characterized by ideal working conditions with calm winds (< 5 m/s, east) and warm temperatures (>20°C) during the 6-8th August 2024. A large, fast moving low-pressure cell located at the Faroe Islands influenced the weather during the following days (8-10th August 2024) and a cold frontal system passing eastwards brought stormy winds (> 15 m/s). The temperature dropped to 16.4 °C in the southwestern Baltic Sea. As a result, the wave height exceeded more than 2.5 m, and therefore we decided to sail northwards to seek for shelter at the coast east of Øland. The forecast of persistent unfavorable weight

heights in the southeastern Gotland Basin forced us to change the cruise plan and sail northwards in order to conduct the sampling program along the Thalweg in the opposite direction that originally planned.

In the beginning of the second week, the harsh weather calmed slowly down. The work resumed at still strong winds (12-15 m/s) and wave heights of 2m. Sailing around the island of Gotland, the cruise of RV ELISABETH MANN became increasingly under the influence of a high-pressure cell located in northern France that moved eastwards. This cell influenced widely the weather in the Baltic Sea and resulted in calm wind and warm air temperatures during 12-15th August 2024. A low-pressure zone northeast of Island and a frontal system influenced the weather during the weekend of the 16th-18th August across the Baltic Sea. It slowly moved eastwards and replaced the high-pressure zone. Nevertheless, calm winds from west dominated and continued to provide further ideal working conditions.

5.2 Observations at Main Stations and the Baltic Thalweg Transect

5.2.1 CTD Measurements

The most important hydrographic and chemical parameters at the main stations of the investigation are summarized in Tables 5.1 and 5.2 as well as Figures 5.2 and 5.3. The position for these stations is provided in Figure 3.1.

The surface temperature (SST) and salinity (SSS) showed a west-east gradient typical for the Baltic Sea (Fig. 5.2). Nevertheless, surface temperatures were high in all areas and above the long-term climatological. In most shallow areas such as the Kiel Bight, the Bay of Mecklenburg and the Stolpe Channel, it exceeded 20°C but ranged between 19-20°C in the deeper areas of the Bornholm and Gotland Basins. Only at the Landsort Deep, the surface temperature was in the range of the long-term values (16.9°C). In contrast, the surface salinity was in the range of the long-term observations. Typical for summer, it is lower in the western areas of the Baltic Sea (Kiel Bight-Bay of Mecklenburg: 10.0 – 11.3 PSU). From the Darss Sill onwards, a strong influence of the Baltic Proper with a salinity smaller than eight PSU was visible.

The deep-water conditions typically diverged from the surface distribution of the hydrographical variables (Tab. 5.2). The Fehmarn-Belt, Bay of Mecklenburg and the Arkona Basin, showed a warm, saline water with a salinity > 27 PSU at the bottom and less warm and saline at intermediate depths. The transport of the deep water into the Bornholm Basin was associated with a reduction of the salinity. It formed a warm layer (10-12°C, 12-14 PSU) at the top of the halocline in the western areas of the Basin. The salinity of this core was not elevated above the usual, though. Further east, the typical layering of cold, brackish water (~4°C, 8-11 PSU) above the warmer, more saline bottom water occurred (6-8°C, > 11 PSU).

Nearly the entire central Baltic was covered by anoxic bottom waters, enriched with free hydrogen sulphide (Gotland, Farö, Landsort Deeps, Fig. 5.2, Tabs. 5.1, 5.2). The deep water in the Bornholm Basin was hypoxic (< 20 µmol O₂/L). In contrast, the deep water in the Stolpe channel and the southern slope of the eastern Gotland Basin displayed oxygen levels above 50 µmol O₂/L, indicating a recent transport of oxygen rich water into the central Baltic Sea.

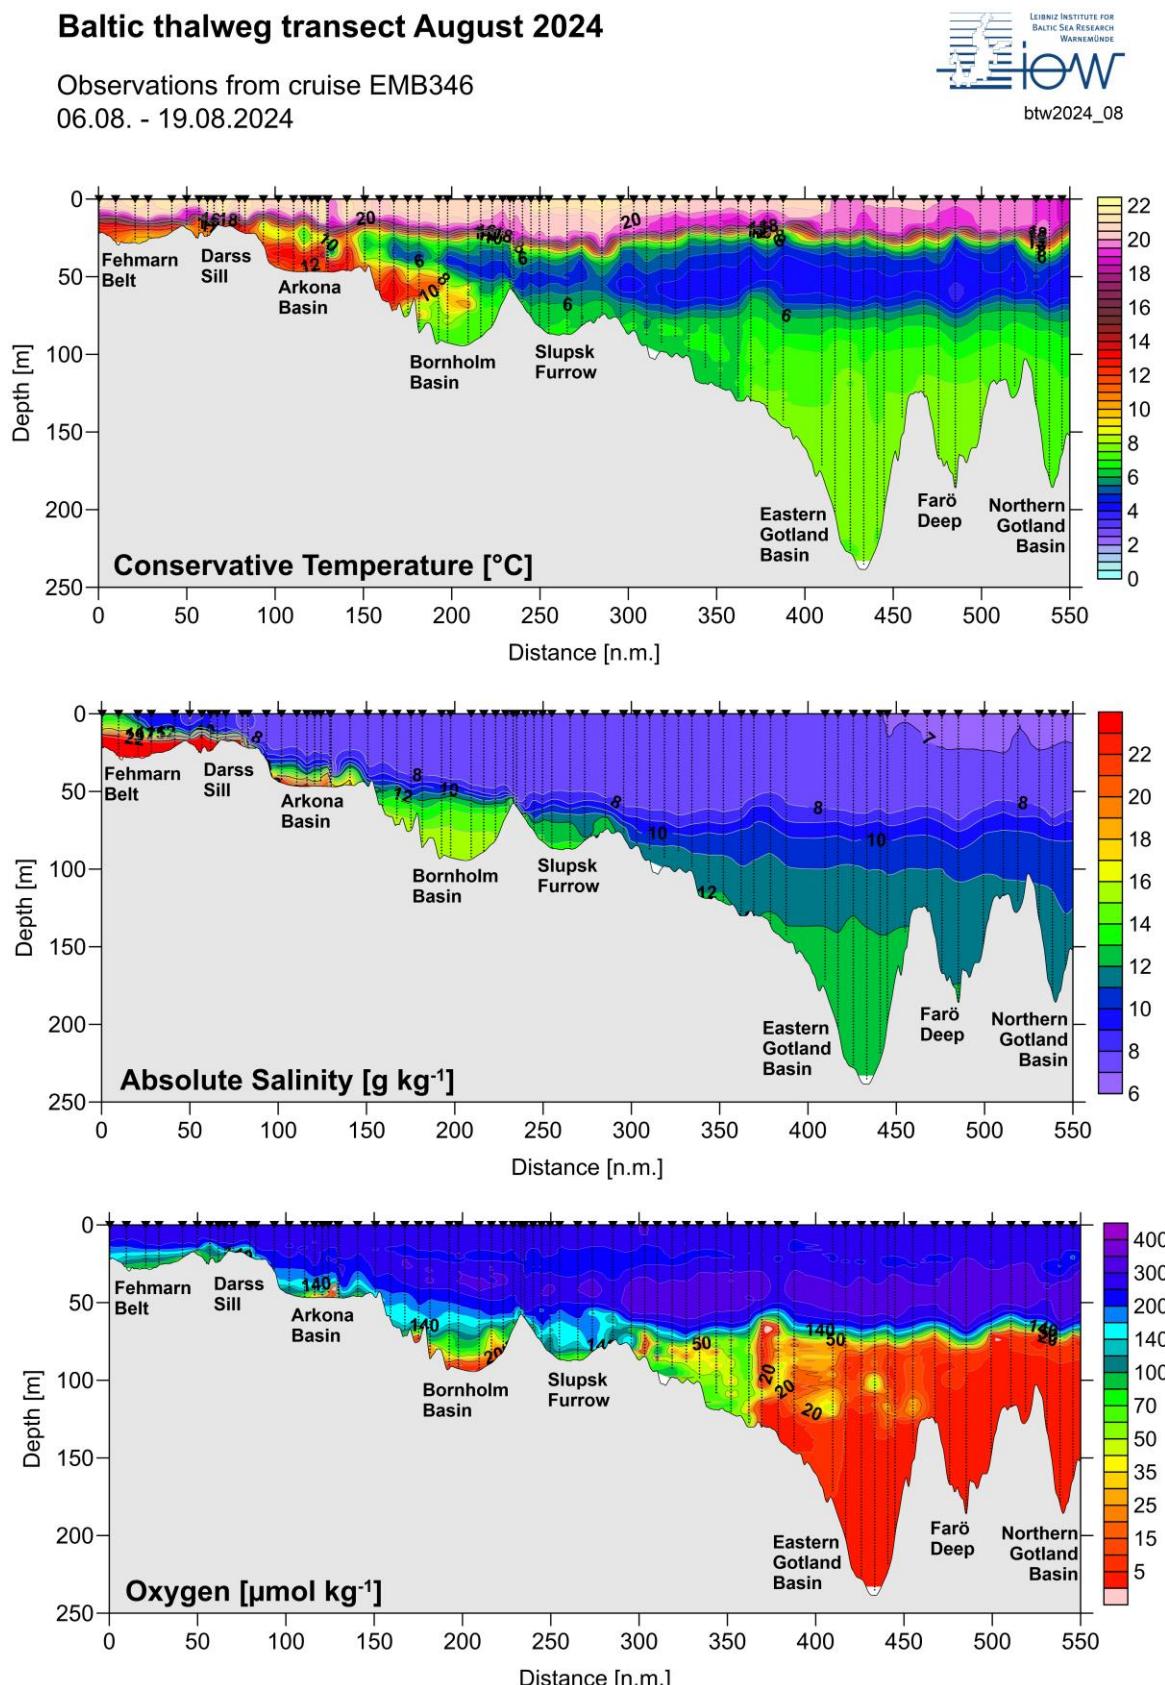

Fig. 5.2 Distribution of temperature (°C), salinity (PSU) and oxygen concentrations (ml/L) along the Thalweg transect of the Baltic Sea from the Kiel Bight to the eastern Gotland Basin. The figure is based on the preliminary CTD data collected during the cruise EMB346 from the 06.08. -19.08.2024.

Landsort Deep.	TF0284	6.86	10.96	3.3	-108.8	4.30	0.00	74.8

5.2.2 Nutrients and Chlorophyll

The concentrations of phosphate and nitrate in the surface water were low (< 0.31 µM, Table 5.1). This is expected for the summer period when nutrients are depleted following the spring phytoplankton bloom. In contrast, silicate was not depleted and show high values especially in the Gotland Basin. In contrast, all nutrient concentrations in the bottom water here high (Table 5.2). In agreement with the low nutrient concentrations, Chlorophyll a fluorescence was below 3 units. In the western Baltic Sea, surface values were generally higher because of the shallowness of the area that allows for vertical mixing by winds and lateral transport. In the central Baltic Sea, the concentrations were below 1.5 units.

5.3 Establishment of an eDNA-Archive and Metaproteogenomic Analyses

For a bio-archive of microorganisms and metazoans in the North and the Baltic Sea, biomass is collected by filtering seawater either through a 0.2 µm or a 0.45 µm filter to obtain respectively bacterial and metazoan DNA (CREATE project). All samples are frozen directly and stored at -20 °C and are available for further processing like DNA extraction and sequencing.

For metaproteogenomic analyses, surface water samples of 60 L were collected by a CTD-Rosette system. Subsequently, the water was filtered through 10 µm, 3 µm and 0.2 µm filters, respectively. Filters were stored at -80 °C. Macro- and microalgae, found on the 10 µm and 3 µm filters and bacteria derived from the 0.2 µm filter are available for metagenomic and metaproteomic analyses and furthermore for the determination of bacterial metabolic activity. (Responsible scientists: Prof. Dr. Matthias Labrenz, IOW, Dr. Norma Welsch, Uni-Greifswald, Dr. Anneke Heins, MPI-Bremen).

5.4 Radionuclides in the Western Baltic Sea

Sampling to determine radionuclides was carried out in accordance with the “General Administrative Regulation for the Integrated Measurement and Information System for Monitoring Radioactivity in the Environment (AVV-IMIS)” and the associated measurement instructions D-Cs-MWASS-01 of the Control Center D for Seawater, Marine Suspended Matter and Sediment. The AVV-IMIS schedules for quarterly sampling of the surface seawater at selected stations in the Baltic Sea. These samples are examined for their Cs-137 and Sr-90 activity concentration. Since the BSH was unable to carry out sampling of these stations in the third quarter of 2024, the IOW has agreed to carry out the sampling during voyage EMB 346. Two 35-liter barrels were filled with near-surface seawater at four stations using the ship's own seawater pipe. The processing of these samples in the BSH laboratory in Hamburg-Sülldorf has already taken place, but measurements, evaluations and plausibility checks are still pending (Responsible scientist: Dr. S.A.K. Schmied, BSH).

5.5 Identification of Accumulation Areas for UV-filter Substances

The sampling aims to identify enrichment areas for homogeneous or heterogeneous distribution of UV Filters across the coastal areas, bays and the open Baltic Sea. Also, identify the transport processes for the occurrence of UV Filters in the Baltic Sea. Given the importance of seasonal variations in concentrations of UV Filters in the Baltic Sea, this summer cruise will aid in providing crucial information. This is the seventh of eight cruises.

Water samples were taken at the surface, “ChlAmax”, and near bottom layer for the following stations (Tab. 1). The collection of samples from various depths will assist us in determining the variation in distribution of UV Filters in the Baltic Sea at different depths. ChlAmax is being collected specifically to help us correlate the UV Filter concentration in algae and whether they act as a link for UV Filter deposition in sediment.

Solid phase extraction done to analyze the UV Filters. The samples were filtered using Chromabond HLB cartridges on board. Further, extractions and analysis using LC-MS/MS will be carried out at Julius Kühn-Institut, Berlin. Additional samples were taken for Titanium dioxide, as a marker for mineral UV Filters, as a comparison for the organic UV Filters. (Responsible scientist: Harshada Sakpal, Julius Kühn-Institute, Berlin and IOW, Dr. Kathrin Fisch, Julius Lühn-Institute, Berlin, Dr. Marion Kanwischer, IOW, Prof. Detlef Schulz-Bull, IOW).

5.6 Analysis of PFAS Substances

The Interreg Baltic Sea Region program funded project EMPEREST (Eliminating Micro-Pollutants from Effluents for REuse Strategies, <https://interreg-baltic.eu/project/emperest/>) aims at the development of new technologies for the removal of organic micro-pollutants such as pharmaceuticals and in particular perfluorinated alkylated substances (PFAS) from wastewater. Moreover, the EMPEREST partner HELCOM aims at the development of methodological recommendations for a harmonized monitoring of PFAS substances in the Baltic Sea region.

In order to increase the number of data for concentrations of PFAS substances in waters of the German EEZ, IOW provided surface water samples from this region to the project partner Prof. Barjenbruch (Technische Universität Berlin, Dpt. Urban Water management).

During cruise EMB346 surface water samples were obtained at similar sites as for the samples for UV filter analysis (Table 1) using the carousel water sampler. Harshada Sakpal conducted the sampling onboard. The 1 L samples were stored in PE bottles and handed over to Prof. Barjenbruch and colleagues after the cruise who forwarded them to an external laboratory for PFAS analysis. (Responsible scientist: Dr. Marion Kanwischer, IOW).

5.7 Biological Sampling

Samples for the investigation of the seasonal and long-term variation of the phytoplankton and zooplankton were collected on selected station for the subsequent analysis in the laboratory. This analysis is time consuming and is initiated once samples were brought to the laboratory. Therefore, preliminary results are not available yet.

6 Ship's Meteorological Station

Not applicable on RV ELISABETH MANN BORGESE. The meteorological conditions during the cruise are described in section 5.1.

7 Station List EMB346/2024

8 Data and Sample Storage and Availability

All data will be stored on a data repository in the IOW immediately after the cruise. The processed and validated data will be stored in the ODIN data base (<https://odin2.io-warnemuende.de>). According to the IOW data policy and to facilitate the international exchange of data, all metadata will be made available under the international ISO 19115 standards for georeferenced metadata. Afterwards the data will be delivered to national and international databases (MUDAB, HELCOM, ICES).

The access to the data itself will be restricted for three years after data acquisition to protect the research process, including scientific analysis and publication. After that period the data becomes openly available to any person or any organization who requests them, under the international Creative Commons (CC, <https://creativecommons.org/licenses/by/4.0/>) data license of type CC BY 4.0. For further details refer to the IOW data policy document.

Table 8.1 Overview of data availability

Type	Database	Available	Free Access	Contact
Hydrographic data	ODIN	01.05.2025	01.05.2025	volker.mohrholz@io-warnemuende.de
Nutrient data	ODIN	01.05.2025	01.05.2025	joachim.kuss@io-warnemuende.de
Biological data	MUDAB	01.08.2025	01.12.2025	joerg.dutz@io-warnemuende.de

9 Acknowledgements

We would like to thank the captain and the crew of the RV Elisabeth Mann Borgese for their support during the cruise, as well as the cruise participants from the Leibniz Institute for Baltic Sea Research Warnemünde who carried out the measurements as part of the HELCOM's Baltic Sea monitoring program and the IOW's long-term measuring program. We are also grateful to all colleagues involved in the preparations of the cruise. The cruise was funded by institutional funds of the IOW and the Federal Maritime and Hydrographic Agency, Hamburg and Rostock.
